

Gajian Aman - Minor Update v1

Gajian Aman — Analytics & UX Fix Instructions

Read all related PRD and Telegram Bot documentation first before making changes.

Implement the following fixes and feature updates carefully.

1. Analytics Sidebar Selection Bug

Current Problem

Inside the Analytics sidebar/menu:

- "Pola Waktu"
- "Tren"

are both visually selected at the same time.

This creates inconsistent navigation state and confusing UX.

Required Fix

Only ONE analytics menu item may be active/selected at a time.

Requirements:

- active state must follow current route/page,
- selected item must update immediately after navigation,
- inactive menu items must fully lose active styling,
- preserve hover state separately from active state.

Example:

- if user is inside `/analytics/pola-waktu`
→ only "Pola Waktu" highlighted.
 - if user is inside `/analytics/tren`
→ only "Tren" highlighted.
-

2. Forecasting (Prakiraan) Feature Expansion

Current State

Currently only monthly forecasting exists.

Required Update

Add forecasting modes:

A. Weekly Forecasting

User can view:

- predicted weekly expenses,
 - predicted weekly income,
 - predicted weekly cashflow,
 - wallet/kantong trends weekly.
-

B. Monthly Forecasting (Existing)

Retain current monthly forecasting functionality.

UX Requirements

Inside Forecasting page:

- add forecast mode switcher/tab:
 - Mingguan
 - Bulanan

Requirements:

- smooth switching,
 - independent chart rendering,
 - proper loading states,
 - mobile responsive.
-

Suggested Forecast Metrics

Weekly:

- estimated spending this week,
- predicted remaining balance,
- top predicted categories,
- predicted wallet depletion risk.

Monthly:

- existing functionality,
 - improve visualization consistency.
-

3. Custom User Categories

Current Problem

Users can only use admin-defined categories.

This limits personalization and real-world usability.

Required Feature

Allow users to create their own categories.

Requirements

User-Created Categories

Users can:

- create category,
 - edit category,
 - delete category,
 - assign icon/color,
 - assign category type:
 - income
 - expense
 - transfer(optional)
-

Rules

System Categories

Admin/default categories:

- cannot be deleted,
- can still be used normally.

User Categories

- scoped per user,
 - isolated between accounts,
 - searchable,
 - selectable during transaction creation.
-

UX Requirements

Add:

- "+ Tambah Kategori"
 - category management modal/page
 - category selector improvements
-

Database Requirements

Support:

- system categories
- custom user categories

Suggested fields:

- category_id
 - user_id(nullable for system categories)
 - category_name
 - category_type
 - icon
 - color
 - created_at
-

4. Overview Dashboard Improvement

Current Problem

The dashboard overview does not immediately show the most important daily information.

Users primarily want to quickly see:

- today's spending,
 - today's transactions,
 - today's cashflow activity.
-

Required Update

Prioritize "Today Summary" inside Overview/Home dashboard.

Add Section:

"Ringkasan Hari Ini"

Include:

- total pengeluaran hari ini,
 - total pemasukan hari ini,
 - jumlah transaksi hari ini,
 - latest transactions,
 - top spending category today,
 - active wallet balances(optional).
-

UX Requirements

This section should appear near the TOP of Overview page.

Requirements:

- glanceable,
- fast to understand,
- mobile-first,
- minimal clutter,
- visually prioritized.

Suggested Components

Today Cards

- Pengeluaran Hari Ini
- Pemasukan Hari Ini
- Total Transaksi
- Saldo Hari Ini

Transaction Feed

Show latest:

- 5–10 transactions.

5. Technical Requirements

Follow existing architecture principles:

- modular components,
- reusable services,
- clean state management,
- responsive UI,
- production-grade implementation.

6. Important Notes

Do NOT:

- break existing analytics routing,
- hardcode active menu states,
- mix weekly/monthly forecast states,
- allow category duplication issues,
- degrade mobile responsiveness.

Ensure:

- proper loading states,
- proper empty states,
- proper validation,

- clean UX consistency across analytics pages.

Implement all updates production-ready.

Additional Gajian Aman Fix & Feature Instructions

Continue following all existing PRD and technical documentation.

Implement the following additional UX and feature improvements.

7. Expense Category Detail Breakdown

Current Problem

Inside the "Pengeluaran" page, category visualization lacks transaction-level drilldown visibility.

Users need to understand:

- where the spending came from,
 - which transactions contributed to each category,
 - transaction composition per category.
-

Required Feature

Each expense category must support detailed transaction breakdown.

Required Behavior

When user clicks/selects a category:

- open category detail view,
OR
- expand category section,
OR
- show modal/drawer.

The detail must display:

- all transactions under that category,
- total category spending,

- transaction count,
 - percentage contribution,
 - timeline/history.
-

Required Information

Category Summary

Show:

- category name,
 - total spending,
 - transaction count,
 - average transaction value,
 - percentage of total spending.
-

Transaction Breakdown

Each transaction item should display:

- description,
- amount,
- wallet/kantong,
- transaction date,
- optional merchant/source.

Example:

```
Food & Beverage  
Rp450.000 total  
12 transaksi
```

```
- Kopi Kenangan - Rp35.000  
- FamilyMart - Rp50.000  
- Ayam Geprek - Rp28.000
```

UX Requirements

Requirements:

- fast drilldown experience,
 - smooth transition,
 - mobile responsive,
 - sortable transaction history,
 - searchable transaction list(optional).
-

Suggested Interactions

Allow:

- click pie/bar chart segment,
 - click category row,
 - click analytics card.
-

8. Gajian Feature Visibility & Prioritization

Current Problem

The "Gajian" feature is one of the core brand differentiators of Gajian Aman, but currently lacks onboarding visibility and navigation priority.

Users may not realize:

- the feature exists,
 - setup is incomplete,
 - salary planning is available.
-

Required Navigation Update

Move:

"Gajian"

to directly below:

"Overview"

inside sidebar/navigation.

New Navigation Priority

Suggested order:

1. Overview
 2. Gajian
 3. Transaksi
 4. Pengeluaran
 5. Analitik
- etc.
-

Gajian Setup Detection

Required Logic

Detect whether user has:

- never setup salary cycle,
 - incomplete salary setup,
 - missing payday information,
 - missing salary wallet/kantong.
-

Overview Page Reminder

If Gajian setup is incomplete:

show onboarding reminder/banner/card prominently inside Overview page.

Example Reminder

Atur fitur Gajian Anda terlebih dahulu untuk mulai mengelola cashflow dengan lebih aman.

CTA:

- Setup Gajian
 - Mulai Sekarang
-

Reminder Requirements

The reminder should:

- only appear if setup incomplete,
 - disappear automatically after setup,
 - not feel intrusive,
 - visually highlighted.
-

Gajian Setup Requirements

The setup flow should support:

- payday date,
 - salary amount,
 - recurring salary cycle,
 - salary wallet/kantong,
 - optional multiple income sources.
-

UX Objective

The app should strongly communicate:

"Gajian Aman is a salary-first financial management app."

The Gajian feature must feel:

- primary,
 - core to the product identity,
 - foundational to the user journey.
-

Important Notes

Do NOT:

- bury Gajian feature inside secondary navigation,
- overload Overview page visually,
- create intrusive popups,
- make setup mandatory before app usage.

Ensure:

- onboarding clarity,
- smooth setup flow,
- clean dashboard hierarchy,
- consistent mobile UX.

Additional Reporting, Budgeting, UX, and Financial Planning Improvements

Continue following all existing PRD, analytics, budgeting, and Telegram Bot architecture documents.

Use the attached "Budget" application screenshots as UX inspiration/reference only. Do NOT copy directly.

Adapt and improve Gajian Aman's existing design system and flows.

9. Budgeting & Categorization System Expansion

Current Problem

The budgeting and categorization structure is still too flat.

Users need:

- parent categories,
 - subcategories,
 - financial grouping structure,
 - better organization for budgeting analysis.
-

Required Feature

Add support for:

- kategori,
 - subkategori,
 - category grouping.
-

Example Structure

Group Kategori

Examples:

- Sumber Pemasukan
 - Kebutuhan
 - Keinginan
 - Tabungan
 - Investasi
 - Tagihan
 - Dana Darurat
-

Subkategori Examples

Kebutuhan

- Makan
- Listrik
- Air
- Internet
- Transport

Keinginan

- Nongkrong
- Gaming
- Shopping

Tabungan

- Dana Nikah
 - Rumah
 - Liburan
-

Required Capabilities

Users must be able to:

- create kategori,
- create subkategori,
- assign parent group,
- edit/delete custom categories,

- assign budget allocation per category/subcategory,
 - filter reports by group/subgroup.
-

Database Requirements

Suggested structure:

Category Group

- group_id
- group_name
- icon
- color

Category

- category_id
- parent_group_id
- category_name
- type
- icon
- color

Subcategory

- subcategory_id
 - parent_category_id
 - subcategory_name
-

UX Requirements

Budget/category UI should support:

- collapsible hierarchy,
 - easy selection,
 - visual grouping,
 - fast transaction assignment.
-

10. Visual Hierarchy & Contrast Improvement

Current Problem

Important information is not visually prioritized enough.

Users should instantly understand:

- what is important,
 - what needs attention,
 - financial risks,
 - key summaries.
-

Required UX Principle

Higher importance information must have:

- stronger contrast,
 - larger typography,
 - stronger visual weight,
 - clearer spacing,
 - more dominant positioning.
-

Examples

High Priority Information

Examples:

- saldo tersisa,
- pengeluaran hari ini,
- budget hampir habis,
- tagihan mendatang,
- cashflow risk,
- runway dana darurat.

Should use:

- stronger font weight,
 - higher contrast,
 - larger cards,
 - emphasized colors.
-

Lower Priority Information

Examples:

- secondary insights,
- supporting analytics,
- metadata.

Should appear visually lighter.

11. Chart Axis Formatting Improvement

Current Problem

Chart labels currently display raw values:

- 500000
- 1000000

This reduces readability.

Required Fix

Format large values into compact readable notation.

Examples:

- 220K
 - 1.5M
 - 2.5M
 - 15RB
-

Required Formatting Rules

Value	Display
1500	1.5K
220000	220K
2500000	2.5M
1500000000	1.5B

Use consistently across:

- bar charts,
 - column charts,
 - tooltips,
 - summary cards,
 - analytics pages.
-

12. Reporting Page Enhancement

Reference Inspiration

Use attached "Budget" app reporting screenshots as inspiration for:

- information hierarchy,
- quick summaries,
- financial health presentation,
- dashboard organization.

Adapt into Gajian Aman's branding and UX.

Required Additions

Ringkasan Cepat

Add:

- rata-rata pengeluaran per hari,
 - hari terboros,
 - total transaksi bulan ini,
 - hari tanpa pengeluaran,
 - spending consistency,
 - top spending wallet.
-

Financial Health Score

Optional but recommended:

Add simplified:

"Skor Kesehatan Finansial"

Factors:

- tabungan,
 - budgeting discipline,
 - emergency runway,
 - debt ratio,
 - cashflow consistency.
-

Enhanced Trend Visualization

Improve:

- pemasukan vs pengeluaran trend,
 - category trend,
 - wallet flow trend,
 - savings growth trend.
-

13. Upcoming Bills / Recurring Financial Planning

Required Feature

Add support for:

- upcoming bills,
 - recurring expenses,
 - recurring income,
 - reminders,
 - due date tracking.
-

Examples

Users can setup:

- listrik,
- internet,
- kontrakan,
- cicilan,
- subscriptions,

- insurance,
 - salary date.
-

Required Capabilities

Users should be able to:

- create recurring bills,
 - set due dates,
 - set recurring frequency,
 - assign wallet,
 - mark as paid,
 - enable reminders.
-

Recurring Frequencies

Support:

- weekly,
 - monthly,
 - yearly,
 - custom intervals.
-

Reminder System

Reminder channels:

- in-app notification,
 - Telegram bot notification,
 - optional push notification.
-

Suggested UI Placement

Inject strategically into:

- Overview dashboard,
- Gajian page,

- Budget page,
 - Calendar view.
-

Example Overview Widget

"Tagihan Mendatang"

Display:

- nearest due bills,
- total upcoming obligations,
- due countdown,
- payment status.

Example:

```
Internet - Rp350.000 - jatuh tempo 3 hari lagi  
Listrik - Rp250.000 - besok
```

14. Calendar & Financial Timeline Enhancement

Improve monthly calendar activity visualization.

Requirements:

- transaction indicators,
 - bill due indicators,
 - payday indicators,
 - savings events,
 - recurring payment markers.
-

15. Important UX Principles

The application should feel:

- proactive,
- financially intelligent,
- low friction,
- emotionally calming,

- salary-first,
- planning-oriented.

Do NOT make it feel:

- accounting-heavy,
 - spreadsheet-heavy,
 - overwhelming.
-

16. Technical Requirements

Ensure:

- scalable category hierarchy architecture,
 - reusable chart formatting utilities,
 - modular analytics components,
 - efficient query performance,
 - mobile responsiveness,
 - smooth animation/transitions,
 - accessible UI contrast.
-

17. Final Product Direction

Gajian Aman should evolve into:

- a salary-first financial operating system,
- conversational finance assistant,
- budgeting + planning ecosystem,
- financial behavior companion,
- intelligent cashflow manager.

Not merely:

- expense tracker,
- transaction logger,
- static budgeting app.
